

Directorate supports Sensor Information Technology

by Francis L. Crumb, Information Directorate

ROME, N.Y. — The Air Force Research Laboratory Information Directorate recently awarded a \$2,267,800 contract to BBN Technologies of Cambridge, Mass., for technology integration.

Under terms of the three-year agreement, company engineers will develop technology in support of the SenseIT (Sensor Information Technology) program of the Defense Advanced Research Projects Agency (DARPA), Arlington, Va.

“BBN Technologies will be responsible for integrating a number of other research programs and allowing contractors to demonstrate what they have developed,” said Richard Butler, program manager in the directorate’s Information Grid Division. “The Information Directorate is already managing several DARPA contracts in the sensor and information field. This effort will demonstrate how the various parts of the program fit together.” @
